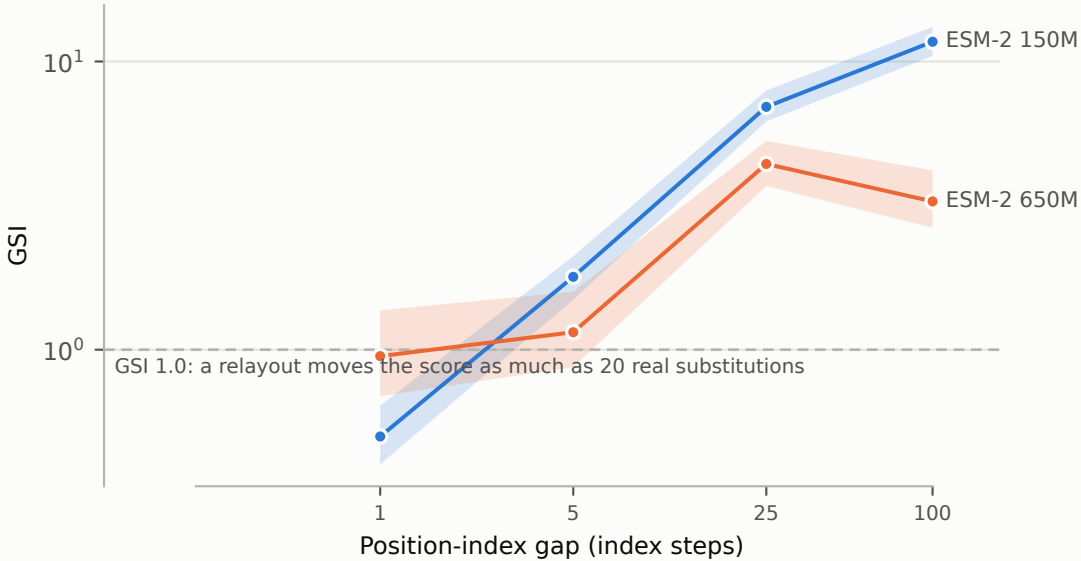
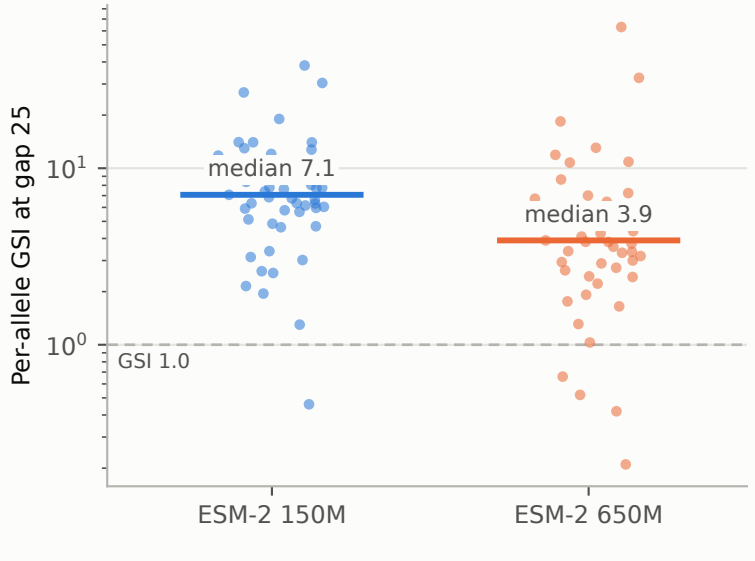
The layout artifact is present across 51 HLA alleles, not carried by HLA-A*02:01

MHC_HEAVY, operator G1, token dropout on. 2 model sizes on an allele-balanced sample: 51 alleles, at most 27 examples each, n = 610, Kish effective sample size 26.86.





GSI is the median absolute score shift from a relayout divided by the median shift from 20 real substitutions. Left: bands are 95% percentile bootstrap intervals resampling alleles.

Right: one point per allele at n = 27, so individual alleles are poorly resolved; the spread is shown to make that visible rather than to support per-allele claims.
