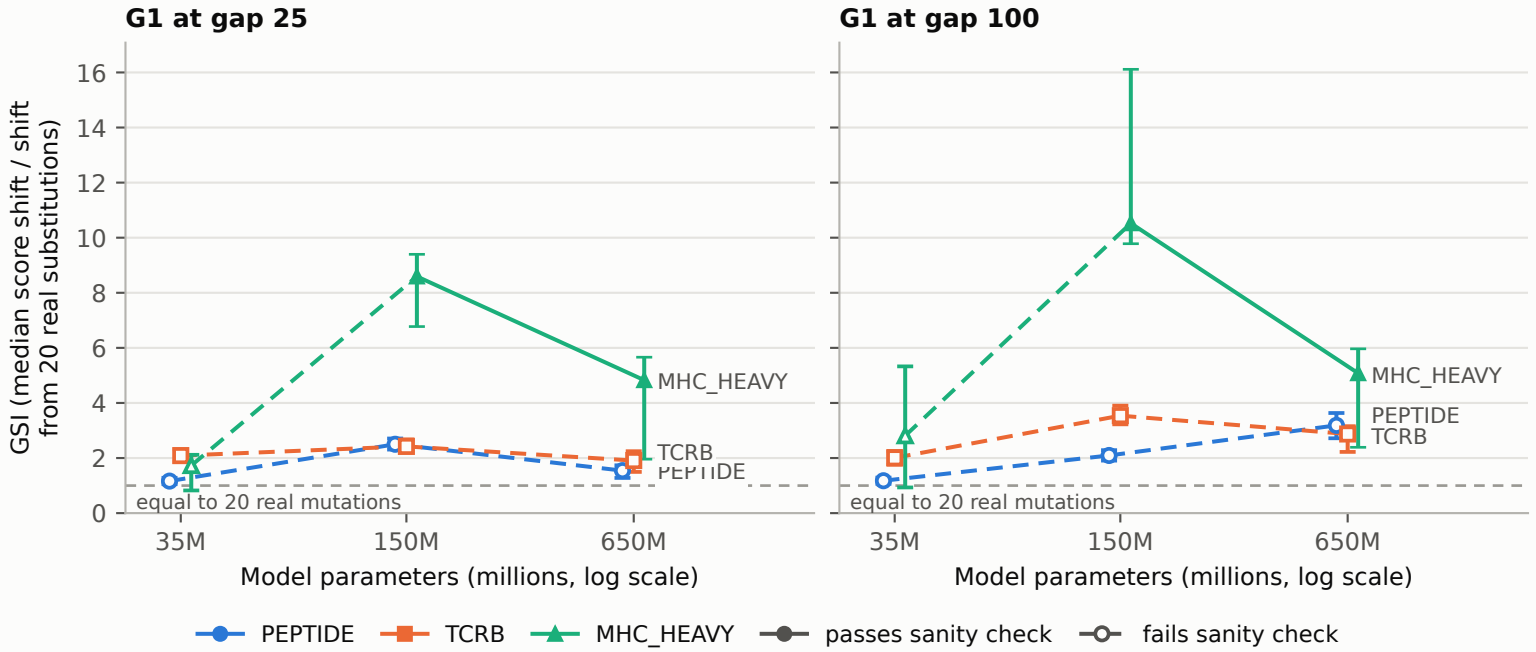
Layout sensitivity decreases with model size but does not disappear

MHC at 150M and 650M, the admissible conditions; still about 5x the effect of 20 real substitutions at 650M.



MHC_HEAVY intervals: cluster bootstrap over alleles, Kish n_eff = 1.92 at 35M and 150M, 1.96 at 650M. PEPTIDE and TCRB intervals: example-level bootstrap.

Estimator fails its sanity check for MHC at 35M and for PEPTIDE and TCRB at every size.
